Open Higgsfield AI

Setup guide: install it, add your key, generate your first video

1. What this is (and what it isn't)

Open Higgsfield AI is a free, open-source **studio interface** (MIT licensed) that gives you Higgsfield-style tools in one place: **Image Studio, Video Studio, Lip Sync Studio and Cinema Studio**. Under the hood it calls 200+ image and video models (Flux, Nano Banana, Seedream, Kling, Sora, Veo, Wan, Seedance and more) through the **Muapi.ai** API.

> **Read this first: what is free**
> The software is free. Generating images and videos is **not** unlimited-free: the app asks for a **Muapi.ai API key**, and generations use your Muapi.ai credits. Check the current credits and pricing on muapi.ai before you start.

2. What you need

Item	Needed for	Notes
Muapi.ai account + API key	Every method	Sign up at muapi.ai, then copy your API key.
Node.js 18 or newer	Run from source	Check with `node -v`.
Git	Run from source	To download the code.
Windows or macOS	Desktop app	Windows x64/ARM64, Mac Intel/Apple Silicon.

3. Pick your method

Method	Effort	Best for
A. Hosted version	2 minutes	Trying it out, no install, no terminal.
B. Run from source	10 minutes	Safest local install, full control.
C. Desktop app	5 minutes	One-click installer, but it is unsigned (see warning).

Method A: Hosted version (no install)

1. Open **muapi.ai/open-higgsfield-ai** in your browser.
2. Sign up for a free account.
3. Choose Image, Video, Lip Sync or Cinema and start generating. Credits are used per generation.

Method B: Run from source (recommended)

1. Install **Node.js 18+** and **Git**.
2. Open a terminal (PowerShell on Windows, Terminal on Mac) and run:

```
git clone https://github.com/Autom8AI/Open-Higgsfield-AI.git
cd Open-Higgsfield-AI
npm install
npm run dev
```

3. Open **http://localhost:3000** in your browser. On first launch it asks for your **Muapi API key**. Paste it and press **Launch Studio**.

To run a production build instead of the dev server:

```
npm run build
npm run start
```

> **If the clone link ever fails**
> The project README lists the original repository as `github.com/Anil-matcha/Open-Higgsfield-AI`. It is the same project, you can clone from there instead.

Method C: Desktop app (Windows and Mac)

Pre-built installers are on the project's **Releases** page: `Open Higgsfield AI-1.0.0-arm64.dmg` (Apple Silicon), `Open Higgsfield AI-1.0.0.dmg` (Intel Mac) and `Open Higgsfield AI Setup 1.0.0.exe` (Windows).

> **Security warning: these installers are NOT signed**
> The README says the app is not notarized by Apple and not code-signed on Windows, so your OS will warn you. Only download from the official Releases page, never from a random link or mirror. If you are not comfortable bypassing OS warnings, use Method A or B instead.

macOS

1. Open the **.dmg** and drag the app into **Applications**.
2. Open Terminal and run:

```
xattr -cr "/Applications/Open Higgsfield AI.app"
```

3. Right-click the app in Applications, choose **Open**, then **Open** again on the dialog. You only do this once.

No-Terminal alternative: try to open the app, then go to **System Settings > Privacy & Security**, find "Open Higgsfield AI was blocked" and click **Open Anyway**.

Windows

1. Run **Open Higgsfield AI Setup 1.0.0.exe**.
2. If SmartScreen shows a warning, click **More info**, then **Run anyway**.
3. It installs to `%LocalAppData%` with a Start Menu shortcut.

First launch (all methods)

1. Paste your Muapi.ai API key when asked.
2. The key is stored in your browser's local storage and is sent only to Muapi.
3. You land in the studio. Pick a tab and generate.

4. Using the four studios

Studio	What you do
Image Studio	Type a prompt for text-to-image (50+ models). Upload a reference image and it switches to image-to-image (55+ models). Some edit models accept up to 14 reference images (for example Nano Banana 2 Edit).

Video Studio	Text-to-video (40+ models, such as Kling, Veo, Wan, Seedance) or upload a start frame for image-to-video (60+ models). Pick aspect ratio and duration (5 to 15 s on several models).
Lip Sync Studio	Upload a portrait image plus an audio file to get a talking video, or switch to Video mode to lip-sync an existing clip. 9 models, including Infinite Talk and LTX 2.3.
Cinema Studio	Choose camera, lens, focal length (8 to 85 mm) and aperture (f/1.4, f/4, f/11). These become prompt modifiers for a cinematic look.

Your first generation

1. Open **Video Studio** and keep the default text-to-video mode.
2. Write a short, concrete prompt. Example: *a hacker's desk at night, neon monitor glow, slow camera push-in*.
3. Pick a model and a short duration first. Short clips cost less while you test.
4. Press **Generate**. Jobs run in the background and the result appears in your history.
5. Download the result in full resolution with the one-click download button.

Handy to know: reference images you upload are saved locally so you never upload the same file twice, and your generation history is kept in your browser storage.

5. Troubleshooting

Problem	Fix
`npm install` errors	Run `node -v`. You need 18 or newer. Update Node and try again.
Page does not open	Check the terminal says the server started, then use http://localhost:3000. If the port is busy, close the other app using it.
Mac says the app is damaged or blocked	Run the `xattr -cr` command above, then right-click > Open.
Windows blocks the installer	SmartScreen > More info > Run anyway (only if it came from the official Releases page).
Key rejected or nothing generates	Re-copy the key from your Muapi.ai account and check you still have credits.
Blank screen after update	Hard refresh the page (Ctrl + Shift + R) or restart the dev server.
